The glove material has to be impermeable and resistant to the product/ the substance/ the preparation.

Selection of the glove material on consideration of the penetration times, rates of diffusion and the degradation

#### Material of gloves

Chemical-resistant protective gloves (EN ISO 374).

Minimum layer thickness: 0.5 mm

Permeation time (breakthrough time): 240 min

The breakthrough times determined in accordance with EN 16523-1 were not carried out under practical conditions.

A maximum wearing time corresponding to 50 % of the breakthrough time is recommended.

Nitrile rubber, NBR

Butyl rubber, BR

Chloroprene rubber, CR

The selection of the suitable gloves does not only depend on the material, but also on further marks of quality and varies from manufacturer to manufacturer. As the product is a preparation of several substances, the resistance of the glove material can not be calculated in advance and has therefore to be checked prior to the application.

#### Penetration time of glove material

The exact break through time has to be found out by the manufacturer of the protective gloves and has to be observed.
